covered by existing guidelines. 4. MAIN GUIDELINE TEXT 4.1 Design, conduct and evaluation of bioequivalence studies The number of studies and study design depend on the physico-chemical characteristics of the substance, its pharmacokinetic properties and proportionality in composition, and should be justified accordingly.

Faculty have used Anderson's TECHNICAL COMMUNICATION: A READER-CENTERED APPROACH to prepare thousands of students for the writing they will do in their careers. Known for its rhetorical treatment of workplace writing and speaking, this text helps students learn practical, flexible strategies for creating useful and persuasive communications on the job. Reorganized and streamlined to enhance student learning, the ninth edition includes greatly expanded attention to social media. It also introduces to technical communication pedagogy a set of exercises and instruction that help students transfer their technical communication knowledge and skills from school to workplace. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

This book provides guidance to readers for how to conduct an integrative review. Over the decades, with the expansion of evidence-based practice (EBP), the evolution of methods used in reviews has resulted in a wide spectrum of review types. Due to the overlapping characteristics of the various review methods, confusion exists related to terminology, descriptions and methods of each type. To fill this gap, this book examines components necessary to conduct a rigorous integrative review from formulating questions through dissemination of the results of the review. Each chapter focuses on one component or step in this process and is written in a straightforward and readable manner. An integrative review is considered by many as an actual research study, hence it should be approached following established research methods involving well defined steps. The integrative review is often compared with the systematic review. Both are used in healthcare research and follow a systematic process in reviewing literature and developing recommendations, but there are important differences that are addressed in the book. Evidence-based practice (EBP) demands high quality, rigorous evidence for nurse clinicians to make informed decisions with and for their patients. In nursing education, the integrative review is a frequent capstone project for graduate students and forms the basis for many doctoral projects. The integrative review process should be valid, reliable and transparent and this book provides clear guidelines for writing an integrative review for students, educators, clinicians, and researchers. This book is a useful addition to courses for both undergraduate and graduate level writers of integrative reviews. In academia, a likely adoption would be in graduate research and research methods courses, and baccalaureate honor courses.
