This book maps the evolution, growth and expansion of human factors in aviation from World War I and through the 20th Century. Written from the perspective of the well-informed pilot, it provides a vivid, practical context for the appreciation of human factors, and is pitched at a level for those studying or engaged in current air transport operations.

On January 13, 1982, Air Florida Flight 90, a Boeing 737-222, was a scheduled flight to Fort Lauderdale, Florida, from Washington National Airport, Washington, D.C. There were 74 passengers and 5 crewmembers on board. The flight was delayed about 1 hour 45 minutes due to a moderate to heavy snowfall. Shortly after takeoff the aircraft crashed at 1601 e.s.t. into the 14th Street Bridge over the Potomac River and plunged into the ice-covered river, 0.75 nmi from the departure end of runway 36. Four passengers and one crewmember survived the crash. Four persons in the vehicles on the bridge were killed; four were injured. The National Transportation Safety Board determines that the probable cause of this accident was the flightcrew's failure to use engine anti-ice during ground operation and takeoff, and to take off with snow/ice on the airfoil surfaces of the aircraft. Contributing to the accident were the ground delay between de-icing and takeoff clearance.

Previous studies showed that air traffic control (ATC) message exchange with a data link offers the potential benefits of increased airspace system safety and efficiency. To accomplish these benefits, data link can be used to reduce communication errors and relieve overloaded ATC voice radio frequencies, which hamper efficient message exchange during peak traffic periods. Flight tests with commercial airline pilots as test subjects were conducted in the NASA Transport Systems Research Vehicle Boeing 737 airplane to contrast flight operations that used current voice communications with flight operations that used data link to transmit both strategic and tactical ATC clearances during a typical commercial airflight from takeoff to landing. The results of these tests that used data link as the primary communication source with ATC showed flight crew acceptance, a perceived reduction in crew work load, and a reduction in crew communication errors. On 25 February 2009 a Boeing 737-800, flight TK1951, operated by Turkish Airlines was flying from Istanbul in Turkey to Amsterdam Schiphol Airport. There were 135 people on board. During the approach to the runway at Schiphol airport, the aircraft crashed about 1.5 kilometres from the threshold of the runway. This accident cost the lives of four crew members, and five passengers, 120 people sustained injuries. The crash was caused by a malfunctioning radio altimeter and a failure to implement the stall recovery procedure correctly.

On 1 January 2007, a Boeing 737-4Q8, operated by Adam Air as flight DHI 574, was on a flight from Surabaya, East Java to Manado, Sulawesi, at FL 350 (35,000 feet) when it suddenly disappeared from radar. There were 102 people on board.. Nine days later wreckage was found floating in the sea near the island of Sulawesi. The black boxes revealed that the pilots were so engrossed in trouble shooting the IRS that they forgot to fly the plane, resulting in the crash that cost the lives of all aboard.

The major objective of this book was to identify issues related to the introduction of new materials and the effects that advanced materials will have on the durability and technical risk of future civil aircraft throughout their service life. The committee investigated the new

materials and structural concepts that are likely to be incorporated into next generation commercial aircraft and the factors influencing application decisions. Based on these predictions, the committee attempted to identify the design, characterization, monitoring, and maintenance issues that are critical for the introduction of advanced materials and structural concepts into future aircraft.

Presents information on flight operations in aircraft with the latest "glass cockpit" advanced avionics systems, covering such topics as automated flight control, area navigation, weather data systems, and primary flight display failures.

The Boeing 737 has a history of rudder system-related anomalies, including numerous instances of jamming. A number of accidents and incidents were the result of the airplanes' unexpected movement of their rudders. During the course of the four and a half year investigation of the crash of USAir Flight 427 near Aliquippa, Pennsylvania, killing 132 people, the NTSB discovered that the PCU's dual servo valve could jam as well as deflect the rudder in the opposite direction of the pilots' input, due to thermal shock, caused when cold PCUs are injected with hot hydraulic fluid. This finally solved the mystery of sudden jamming of the rudders of this aircraft.
