Distributed Artificial Intelligence (DAI) came to existence as an approach for solving complex learning, planning, and decision-making problems. When we talk about decision making, there may be some meta-heuristic methods where the problem solving may resemble like operation research. But exactly, it is not related completely to management research. The text examines representing and using organizational knowledge in DAI systems, dynamics of computational ecosystems, and communication-free interactions among rational agents. This publication takes a look at conflict-resolution strategies for nonhierarchical distributed agents, constraint-directed negotiation of resource allocations, and plans for multiple agents. Topics included plan verification, generation, and execution, negotiation operators, representation, network management problem, and conflict-resolution paradigms. The manuscript elaborates on negotiating task decomposition and allocation using partial global planning and mechanisms for assessing nonlocal impact of local decisions in distributed planning. The book will attract researchers and practitioners who are working in management and computer science, and industry persons in need of a beginner to advanced understanding of the basic and advanced concepts.

If you've landed here, you're probably interested in the world of artificial intelligence and in discovering how this can improve your life, day by day, without your knowing it. How? Read on to find out! Halfway through the 20th century, artificial intelligence began to slowly fit into our daily lives; it all began with a game of checkers, in which the AI developed by Arthur Samuel started to compete against high-level players. From here on, the growth was exponential, ranging from simple electronic calculators to intelligences capable of driving a car on their own in our streets. With this book, you will acquire the fundamentals to understand how such an advanced technology can be in your hands every day, literally, as you can also find it in your smartphone! If

you are an expert on the subject, this book will not reveal anything new to you, but if you are a beginner curious to discover this new subject, then I can assure you that you will not be disappointed. In this book we will talk about: What is an artificial intelligence and how it works. Find out how AI is changing the world of business, the medical field and marketing. Has society really accepted AI? Will this new technology steal your job? Ethics, benefits and disadvantages that artificial intelligence will bring. How this new technology may be implemented in our future. Don't think that this book is too technical, quite the contrary, during its writing I explicated many curiosities related to our daily lives; for instance, did you know that there are artificial intelligences able to understand whether a politician is lying or not? Buy this book to discover this and other curiosities!

The new edition of an introduction to multiagent systems that captures the state of the art in both theory and practice, suitable as textbook or reference. Multiagent systems are made up of multiple interacting intelligent agents--computational entities to some degree autonomous and able to cooperate, compete, communicate, act flexibly, and exercise control over their behavior within the frame of their objectives. They are the enabling technology for a wide range of advanced applications relying on distributed and parallel processing of data, information, and knowledge relevant in domains ranging from industrial manufacturing to e-commerce to health care. This book offers a state-of-the-art introduction to multiagent systems, covering the field in both breadth and depth, and treating both theory and practice. It is suitable for classroom use or independent study. This second edition has been completely revised, capturing the tremendous developments in multiagent systems since the first edition appeared in 1999. Sixteen of the book's seventeen chapters were written for this edition; all chapters are by leaders in the field, with each author contributing to the broad base of knowledge and experience on which the book rests. The book covers basic concepts of computational agency from the perspective of both individual agents and agent organizations; communication among agents; coordination among agents; distributed cognition; development and engineering of multiagent systems; and background knowledge in logics and game theory. Each chapter includes references, many illustrations and examples, and exercises of varying degrees of difficulty. The chapters and the overall book are designed to be self-contained and understandable without additional material. Supplemental resources are available on the book's Web site. Contributors Rafael Bordini, Felix Brandt, Amit Chopra, Vincent Conitzer, Virginia Dignum, Jrgen Dix, Ed Durfee, Edith Elkind, Ulle Endriss, Alessandro Farinelli, Shaheen Fatima, Michael Fisher, Nicholas R. Jennings, Kevin Leyton-Brown, Evangelos Markakis, Lin Padgham, Julian Padget, Iyad Rahwan, Talal Rahwan, Alex Rogers, Jordi Sabater-Mir, Yoav Shoham, Munindar P.
