This text provides a teachable and readable approach to transport phenomena (momentum, heat, and mass transport) by providing numerous examples and applications, which are particularly important to metallurgical, ceramic, and materials engineers. Because the authors feel that it is important for students and practicing engineers to visualize the physical situations, they have attempted to lead the reader through the development and solution of the relevant differential equations by applying the familiar principles of conservation to numerous situations and by including many worked examples in each chapter. The book is organized in a manner characteristic of other texts in transport phenomena. Section I deals with the properties and mechanics of fluid motion; Section II with thermal properties and heat transfer; and Section III with diffusion and mass transfer. The authors depart from tradition by building on a presumed understanding of the relationships between the structure and properties of matter, particularly in the chapters devoted to the transport properties (viscosity, thermal conductivity, and the diffusion coefficients). In addition, generous portions of the text, numerous examples, and many problems at the ends of the chapters apply transport phenomena to materials processing.

Restoration is one thing. Correct restoration is quite another! This extensively researched, beautifully illustrated book describes in detail the correct paint and decals for your Letter Series or McCormick-Deering tractor. Filled with factory drawings indicating decal placement, instructions for factory paint and finish of individual parts, and more for the Farmall A, B, C, H, M, and Cub; the McCormick-Deering -4, -6, and -9; and the Super Series and -TA tractors.

Reveals the proprietary framework used by an exclusive community of top money managers and value investors in their never-ending quest for untapped investment ideas Considered an indispensable source of cutting-edge research and ideas among the world's top investment firms and money managers, the journal The Manual of Ideas boasts a subscribers list that reads like a Who's Who of high finance. Written by that publication's managing editor and inspired by its mission to serve as an "idea funnel" for the world's top money managers, this book introduces you to a proven, proprietary framework for finding, researching, analyzing, and implementing the best value investing opportunities. The next best thing to taking a peek under the hoods of some of the most prodigious brains in the business, it gives you uniquely direct access to the thought processes and investment strategies of such super value investors as Warren Buffett, Seth Klarman, Glenn Greenberg, Guy Spier and Joel Greenblatt. Written by the team behind one of the most read and talked-about sources of research and value investing ideas Reviews more than twenty pre-qualified investment ideas and provides an original ranking methodology to help you zero-in on the three to five most compelling investments Delivers a finely-tuned, proprietary investment framework, previously available only to an elite group of TMI subscribers Step-by-step, it walks you through a proven, rigorous approach to finding, researching, analyzing, and implementing worthy ideas

Mechanical Vibrations, 6/e is ideal for undergraduate courses in Vibration Engineering. Retaining the style of its previous editions, this text presents the theory, computational aspects, and applications of vibrations in as simple a manner as possible. With an emphasis on computer techniques of analysis, it gives expanded explanations of the fundamentals, focusing on physical significance and interpretation that build upon students' previous experience. Each self-contained topic fully explains all concepts and presents the derivations with complete details. Numerous examples and problems illustrate principles and concepts.

The success of a BCI system depends as much on the system itself as on the user's ability to produce distinctive EEG activity. BCI systems can be divided into two groups according to the placement of the electrodes used to detect and measure neurons firing in the brain. These groups are: invasive systems, electrodes are inserted directly into the cortex are used for single cell or multi unit recording, and electrocorticography (EcoG), electrodes are placed on the surface of the cortex (or dura); noninvasive systems, they are placed on the scalp and use electroencephalography (EEG) or magnetoencephalography (MEG) to detect neuron activity. The book is basically divided into three parts. The first part of the book covers the basic concepts and overviews of Brain Computer Interface. The second part describes new theoretical developments of BCI systems. The third part covers views on real applications of BCI systems.

This book constitutes the refereed post-conference proceedings of the 9th International Conference on Mobile Networks and Management, MONAMI 2017, held in Melbourne, Australia, in December 2017. The 30 revised full papers were carefully reviewed and selected from 43 submissions. The papers handle topics in the area of mobile computing, wireless networking and management.

The book presents research papers presented by academicians, researchers, and practicing structural engineers from India and abroad in the recently held Structural Engineering Convention (SEC) 2014 at Indian Institute of Technology Delhi during 22 - 24 December 2014. The book is divided into three volumes and encompasses multidisciplinary areas within structural engineering, such as earthquake engineering and structural dynamics, structural mechanics, finite element methods, structural vibration control, advanced cementitious and composite materials, bridge engineering, and soil-structure interaction. Advances in Structural Engineering is a useful reference material for structural engineering fraternity including undergraduate and postgraduate students, academicians, researchers and practicing engineers.

Most machines and structures are required to operate with low levels of vibration as smooth running leads to reduced stresses and fatigue and little noise. This book provides a thorough explanation of the principles and methods used to analyse the vibrations of engineering systems, combined with a description of how these techniques and results can be applied to the study of control system dynamics. Numerous worked examples are included, as well as problems with worked solutions, and particular attention is paid to the mathematical modelling of dynamic systems and the derivation of the equations of motion. All engineers, practising and student, should have a good understanding of the methods of analysis available for predicting the vibration response of a system and how it can be modified to produce acceptable results. This text provides an invaluable insight into both.
