Fisheries Management in Japan: Its institutional features 1.

The high diversity of Japan's seafood resources is reflected in the great complexity of its multiple-layer fisheries management system. The Fisheries Agency, affiliated to the Ministry of Agriculture, Forestry and Fisheries of Japan (MAFF), is the national government body in charge of Japan's fisheries management.

Japan is one of the world's largest fish-eating countries with a long history, and has developed its own customs and values in terms of managing fisheries resources. The first half of this book introduces the history and institutional features of capture fisheries management in Japan, with 9 case studies from sub-arctic to tropical ecosystems, from sedentary to migratory species, and from small-scale coastal to offshore industrial fisheries. For example, coastal fisheries management is more community-based, and local people have the authority and take priority in the decision-making process. In contrast, offshore fisheries are more industrialized and commercially oriented, and the national government plays a major role in their management. One of the main challenges in world fisheries is to implement the ecosystem approach, but there is no one-size-fits-all solution for its implementation. The second half of this book considers the advantages and limitations of the Japanese fisheries management regime and discusses the necessary environmental policy measures to bridge the gaps between fisheries management and ecosystem-based management. As a case study, management measures in the Shiretoko World Natural Heritage area are analyzed. In closing, the Grand Plan of Japanese fisheries policy for the next 20 years and three future scenarios are presented.

Management of fisheries encompasses inter-action between societal customs, fugitive resources and technology. Fisheries management in Japan consists of two basic types of management techniques: the use of fishing rights for delineating ownership over sedentary

species in littoral zones and licensing systems where management regulations restrict the number and size of fishing vessels. Biological considerations are discussed and the coordination mechanisms required are described for blending resource characteristics with Japanese societal customs. An appraisal is given of the management measures adopted.

Community Based Fisheries Management: A Global Perspective unravels the different aspects of CBFM from different continents and countries. At a time when the population is significantly increasing, with resources decreasing, this resource is directly relevant to helping communities understand and improve fishery production management in a sustainably way. Sections explore various scientific literature on the impact of community-based fishing, participatory management of water bodies, methodologies for studies on community-based fisheries management, and interviews of workers working on community-based fisheries. This information will be most useful to fish farmers, aquaculturists, fish and fishery scientists, research scholars and anyone else interested in this field. Based on 30 years of scientific research, this resource emphasizes the need for the management of resources through the involvement of the local community while also providing a framework for participatory collaboration. Provides methods of data collection and statistical tools for data analysis Presents the basic procedures necessary to conduct a CBFM study Includes information on the impacts of climate change and economics

This book explores how we can solve the urgent problem of optimizing the use of variable, uncertain but finite fisheries resources while maintaining sustainability from a marine-ecosystem conservation perspective. It offers readers a broad understanding of the current methods and theory for sustainable exploitation of

fisheries resources, and introduces recent findings and technological developments. The book is divided into three parts: Part I discusses fish stock dynamics, and illustrates how ecological processes affecting life cycles and biological interactions in marine environments lead to fish stock variability in space and time in major fish groups; small pelagic fish, demersal fish and large predatory fish. These insights shed light on the mechanisms underlying the variability in fish stocks and form the essential biological basis for fisheries management. Part II addresses the technologies and systems that monitor changes in fisheries resources and marine ecosystems using two approaches: fishery-dependent and fishery-independent data. It also describes acoustic surveys and biological sampling, as well as stock assessment methods. Part III examines management models for effectively assessing the natural variability in fisheries resources. The authors explore ways of determining the allowable catch in response to changes in stock abundance and how to incorporate ecological processes and monitoring procedures into management models. This book offers readers a broad understanding of sustainable exploitation as well as insights into fisheries management for the next generation.

During the first half of the 1990s, in response to the increasing concern about many of the world's fisheries, a number of international fisheries instruments provided an impetus for countries to strengthen their fisheries management. A key step in supporting such efforts is the development of more detailed, systematic and comparable information on fisheries environments and management trends. The State of World Marine Capture Fisheries Management Questionnaire was developed by FAO in 2004 to help meet this need. The results have been grouped by region and are reported in this publication. More than a decade later, we are able to look back to see how countries responded, to examine whether more fisheries are managed and to determine whether the management tools and

strategies employed have improved the overall situation in marine capture fisheries. Trends in legal and administrative frameworks, management regimes and status of marine capture fisheries are analysed for 29 countries in the Pacific Ocean and presented in this report and on the accompanying CD-ROM as an easy-to-read and informative reference for policy decision-makers, fishery managers and stakeholders.

Few nations rely upon the ocean as much as Japan for livelihood, culture and transport. The seas have long played a vital role for the Japanese, helping to support the economic and social life of a nation that possesses few resources and little arable land, and sustain a population that has nearly tripled in the last century. Fish are a distinctive feature of the Japanese diet, constituting nearly half of all animal protein consumed – the highest rate in the world. The industry itself has provided an impetus for coastal community growth and national economic development over the past century, while fisheries have worked their way into Japanese culture and customs, serving as a dominant symbol in traditional arts and folklore. This book explores the overarching rationale that motivated Japanese international fisheries policy throughout the post-war period until today, highlighting the importance of international fisheries to Japan and the stature this resource has occupied as a national interest. It provides a comparative view of Japanese foreign policy at various ocean conferences, treaty negotiations, bilateral diplomatic initiatives and other maritime relations that constitute ocean policy over half a century, and investigates the domestic constituents of national policy. Roger Smith argues that the rationale for international fisheries policy may be best viewed as deriving from Japan's unique defence strategy for its national interests: comprehensive security. Encompassing non-military elements and most importantly defence of economic

interests, Japan's international fisheries policy provides an interesting case study of how comprehensive security is conceptualised and carried out. Taking a broad view of Japan's international fisheries policies from 1945 to the present, this book highlights the key trends in policy motives and means throughout the post-war period. As such, it will be of great interest to students and scholars of Japanese studies, international and environmental law, resource management and international relations, as well as to policy makers working in the field.

In anticipation of the UN Conference of the Law of the Sea taking place in 1973, Dr Kasahara and Dr Burke of the University of Washington first published *North Pacific Fisheries Management* earlier that year. The conference brought fishery territories to a global stage with delegates that may not be as informed about ocean issues as those previously making decisions. Therefore the Program of International Studies of Fishery Arrangements was created to explore the management of fisheries in specific regions. This study focusses on the North Pacific region and delves into the implications of a global regime, generic problems concerning fishery management, distribution and institutions as well as alternative arrangements that can be made to make the management of fisheries smoother. This title will be of interest to students of environmental studies and policy makers.

Lagoons are characterized by an essential quality of uncertainty for use in resource management: these are physically vulnerable to various influences from not only the environment but also the adjacent marine and terrestrial areas. This book presents a variety of lessons learned from case studies from Asian countries (India, Japan and Thailand).
