The eTrex 10 GPS is incredibly buggy: the display often goes completely blank after scrolling through menus immediately after taking a fix, characters are arbitrarily deleted while entering notes on waypoints, part of the satellite page goes blank when viewing the number of satellites and their respective signal strengths, the unit often takes up to 10 seconds to update after pressing the joystick to enter data, and the joy stick often moves the cursor to the wrong data field.

This open access peer-reviewed volume was inspired by the UNESCO UNITWIN Network for Underwater Archaeology International Workshop held at Flinders University, Adelaide, Australia in November 2016. Content is based on, but not limited to, the work presented at the workshop which was dedicated to 3D recording and interpretation for maritime archaeology. The volume consists of contributions from leading international experts as well as up-and-coming early career researchers from around the globe. The content of the book includes recording and analysis of maritime archaeology through emerging technologies, including both practical and theoretical contributions. Topics include photogrammetric recording, laser scanning, marine geophysical 3D survey techniques, virtual reality, 3D modelling and reconstruction, data integration and Geographic Information Systems. The principal incentive for this publication is the ongoing rapid shift in the methodologies of maritime archaeology within recent years and a marked increase in the use of 3D and digital approaches. This convergence of digital technologies such as underwater photography and photogrammetry, 3D sonar, 3D virtual reality, and 3D printing has highlighted a pressing need for these new methodologies to be considered together, both in terms of defining the state-of-the-art and for consideration of future directions. As a scholarly publication, the audience for the book includes students and researchers, as well as professionals working in various aspects of archaeology, heritage management, education, museums, and public policy. It will be of special interest to those working in the field of coastal cultural resource management and underwater archaeology but will also be of broader interest to anyone interested in archaeology and to those in other disciplines who are now engaging with 3D recording and visualization.

This volume presents papers given at the 3rd and 4th scientific editions of the conference ▯Methodology and Archaeometry▯ held in 2015 and 2016 at the Faculty of Humanities and Social Sciences of the University of Zagreb, Croatia. It covers topics in archaeometry and archaeological methodology, which represent an essential part of collecting and processing data, which defines the validity of archaeological interpretation. Contributions explore non-destructive archaeology (geophysics and field survey), different aspects of artifact analysis, and experimental archaeology. The text brings together new research from scientists from various disciplines based on a range of methodological, analytical and theoretical perspectives, thus providing new insights and approaches, as well as new theoretical and methodological frameworks in contemporary archaeological science.

This book covers recent advances for quantitative researchers with practical examples from the social sciences. It provides essential information on important issues such as tourism, geography, history, sociology, politics, economy and sport sciences. Each chapter offers a comprehensive range of practical ideas and examples, and all topics are covered by an expert in the field in question. This volume will enable readers to realize that what they see as specific to their own discipline is, in fact, common to several different fields.

Geocaching has steadily grown into a fun and enduring outdoor adventure and with the popularity of GPS units and the development of applications for nearly all of the most popular smartphone platforms, it has become an adventure that's available to pretty much anyone. In The Complete Idiot's Guide® to Geocaching, Third Edition, the editors and staff of Geocaching.com open the world of geocaching up to a much broader audience and take the reader through all of the core essentials for caching including how to play, tips and tricks for finding and placing caches, variations on traditional caching, and much more. In addition, the reader can learn about exciting new changes to the game and the new GPS-enabled games that will take cachers to an entirely new level of fun and adventure.

In the spring of 2010, the Humboldt State University formed the Geospatial Task Force to improve the geospatial curriculum. Assigned to develop a practical series of Geospatial courses that would serve students across multiple programs, two primary areas of assessment were considered. First, the existing curriculum was evaluated for redundancy and overlap. Second, professional requirements were identified to eliminate obsolete content and replace it with relevant job skills. As a member of the Geospatial Task Force, I conducted interviews with both alumni and students to gain first-hand insight into our assessment goals. The consensus from those who had experience with geospatial courses at HSU was that the Intermediate Geographic Information Systems course was outdated and lacked relevancy in terms of job skills and modern analytical methods. This assessment was confirmed when course content was evaluated based on standards defined in the U.S. Department of Labor Geospatial Technology Competency Model. This book is the result of the work and development that followed over the years following the Geospatial Task Force recommendation. Here, readers will find an introduction to several geospatial modeling techniques. Though some tutorials presented here cover similar concepts, each represents a complete and independent exercise. The modeling techniques shown here only scratch the surface of what is possible for each. The intent is to introduce readers to a varied array of geospatial modeling techniques and to prepare students for more advanced work. I sincerely hope that by working through these tutorials, you will develop the skills you need to be successful in the workplace. ▯Nicolas R. Malloy

The concepts and tutorials presented in this book are for readers with little to no experience using geographic information systems (GIS) software. This book is intended for use in an introductory college-level course with freshman students as the target audience. Each of the seven chapters represents approximately two weeks of work for a three-credit 16-week semester course. Each chapter starts with text related to fundamental concepts related to geospatial science and its sub-disciplines: Geodesy Remote Sensing Mobile Mapping Geographic Information Systems Cartography Each chapter also includes one or more tutorials designed to reinforce the concepts learned. These tutorials are suitable for undergraduate lab assignments. Tutorials may take between one to six hours to complete, depending on their complexity. When possible, the authors provide an estimated time to complete tutorials. Additional references, such as video content and external websites, may also be mentioned throughout the text. The second edition of this book includes new tutorials, updated material. Also, it has undergone a peer-review through Humboldt State University Press.

This book introduces the reader to the fast-growing outdoor sport of geocaching, which combines aspects of treasure hunting, high-tech navigation, and exploration. New to this book: --Updates to technology and use of social media. --Full chapter on smartphone apps. --Updates to photography▯showing more technology and diversity of participants. --Mention of National and State Parks, which are now promoting geocaching. --Updates to swag, with official geocaching containers, special edition coins, and micro containers, etc.
