help organizations improve their process safety performance This book provides an introduction and offers approaches for finding and addressing normalization of deviation both in operational and organizational activities. It addresses the initial and long-term effects of normalization of deviations as seen in reduced efficiencies, reduced product quality, extended batch run time, and near miss process safety incidents which can lead to loss of containment of hazardous materials and energies. Recognizing and Responding to Normalization of Deviance addresses how to recognize and respond to the normalization of deviation that can, and almost certainly will, occur in any ongoing operations that involves humans. The book's primary focus is on reducing the incidence of normalization of deviation and the associated increased risk exposure due to its effects when operating

The bibliography was compiled for the purpose of affording students and faculty members of Air University a quick-reference tool for making use of the vast and growing collection of materials in the unclassified holdings of the Air University Library that relate to Latin America.

Although the bulk of the references pertain to the post-1960 period, many are to earlier materials. Coverage, for the most part, ends with 1968 materials. Emphasis is given to economic, political, and historical topics.

**Crystalline Silica** (US Occupational Safety and Health Administration Regulation) (OSHA) (2018 Edition). Updated as of May 29, 2018 The Occupational Safety and Health Administration (OSHA) is amending its existing standards for occupational exposure to respirable crystalline silica. OSHA has determined that employees exposed to respirable crystalline silica at the previous permissible exposure limits face a significant risk of material impairment to their health. The evidence in the record for this rulemaking indicates that workers exposed to respirable crystalline silica are at increased risk of developing silicosis and other non-malignant respiratory diseases, lung cancer, and kidney disease. This final rule establishes a new permissible exposure limit of 50 micrograms of respirable crystalline silica per cubic meter of air (50  $\mu\text{g}/\text{m}^3$ ) as an
