Fluorescence and phosphorescence are proving to be extremely sensitive probes for elucidating conformation of proteins and nucleic acids and for studying molecular interactions. Newer instrumentation and techniques hold forth great promise for the future of these luminescence methods in biopolymer research. It must be noted, however, that the discovery that certain amino acids, purines, and pyrimidines emit fluorescence or phosphorescence is relatively recent, occurring within the last decade. Professor Konev is one of the pioneers in the application of these procedures to biopolymers and is highly qualified to write about this subject. This book, though written largely as a monograph of the author's own contributions, is also an excellent review of the subject. Of particular interest are the references to many important Russian papers in this field which have not been recognized in the Western literature. It is apparent from this book that fluorescence and phosphorescence methods are being used about as widely in Russia as elsewhere in the world and that we must not overlook these important contributions. Konev's studies on protein fluorescence have been widely recognized. It is of interest to learn about these and other of his applications. The last part of the book, which deals with fluorescence as a means to probe into the structure and conformation of macromolecules in intact cells, is most interesting. Aside from published symposia this book is the first written specifically about luminescence of biopolymers. Sidney Udenfriend Bethesda. Maryland May, 1967 v CONTENTS Introduction . • • •

Award-winning African-American playwright August Wilson created a cultural chronicle of black America through such works as Ma Rainey's Black Bottom, Fences, Joe Turner's Come and Gone, The

Piano Lesson, and Two Trains Running. The authentic ring of wit, anecdote, homily, and plaint proved that a self-educated Pittsburgh ghetto native can grow into a revered conduit for a century of black achievement. He forced readers and audiences to examine the despair generated by poverty and racism by exploring African-American heritage and experiences over the course of the twentieth century. This literary companion provides the reader with a source of basic data and analysis of characters, dates, events, allusions, staging strategies and themes from the work of one of America's finest playwrights. The text opens with an annotated chronology of Wilson's life and works, followed by his family tree. Each of the 166 encyclopedic entries that make up the body of the work combines insights from a variety of sources along with generous citations; each concludes with a selected bibliography on such relevant subjects as the blues, Malcolm X, irony, roosters, and Gothic mode. Charts elucidate the genealogies of Wilson's characters, the Charles, Hedley, and Maxson families, and account for weaknesses in Wilson's female characters. Two appendices complete the generously cross-referenced work: a timeline of events in Wilson's life and those of his characters, and a list of 40 topics for projects, composition, and oral analysis.

This entertaining, eye-opening account of how the laws of thermodynamics are essential to understanding the world today—from refrigeration and jet engines to calorie counting and global warming—is “a lesson in how to do popular science right” (Kirkus Reviews). Einstein’s *Fridge* tells the incredible epic story of the scientists who, over two centuries, harnessed the power of heat and ice and formulated a theory essential to comprehending our universe. “Although thermodynamics has been studied for hundreds of years...few nonscientists appreciate how its principles have shaped the modern world” (Scientific American). Thermodynamics—the branch of physics that deals with energy and entropy—governs everything from the behavior of living cells to the black hole at the center of our galaxy. Not only that, but thermodynamics explains why we must eat and breathe, how lights turn on, the limits of computing, and how the universe will end. The brilliant people who decoded its laws came from every branch of the sciences; they were engineers, physicists, chemists, biologists, cosmologists, and mathematicians. From French military engineer and physicist Sadi Carnot to Lord Kelvin, James Joule, Albert Einstein, Emmy Noether, Alan Turing, and Stephen Hawking, author Paul Sen introduces us to all of the players who passed the baton of scientific progress through time and across nations. Incredibly driven and idealistic, these brave pioneers performed groundbreaking work often in the face of torment and tragedy. Their discoveries helped create the modern world and transformed every branch

of science, from biology to cosmology. “Elegantly written and engaging” (Financial Times), Einstein’s Fringe brings to life one of the most important scientific revolutions of all time and captures the thrill of discovery and the power of scientific progress to shape the course of history.
