Manufacturing operations are the real wealth creators within a business, accounting for the majority of management and financial assets needed to sustain the company. *Make it!* encapsulates the author's many years of experience gained designing manufacturing systems and supply-chains in factories across the world. It provides a proven, logical sequence of events needed to design effective modular factories capable of competing with the world's best. In their 1999 'Best-Managed' Companies Awards, 'Aviation Week and Space Technology' (Vol. 150, No. 22) quoted the author's former company, Lucas Aerospace, as achieving 'Most improved major aerospace company 1994 - 1998' status, ranking it second in Competitiveness, assessed by an amalgamation of asset utilisation, productivity and financial stability. This book has been written for managers charged with the responsibility for improving business profitability and for engineers facing the challenge of introducing more cost effective manufacturing processes. Many manufacturing businesses have failed to invest adequate resources in designing factory operations, mainly due to the lack of expertise and detailed knowledge needed to undertake this demanding task. John Garside is a Principal Fellow at Warwick International Manufacturing Group, The University of Warwick. This follows an extensive industrial career in highly competitive first tier system and component manufacturing businesses, who supplied many of the world's leading aerospace, automotive and industrial equipment makers. Written in a concise style giving ready access to information Provides detailed checklists allowing managers to make informed judgements concerning the critical resources needed to meet and exceed customer expectations Informs you how to 'Make it!' imparting practical knowledge on how to create world class factories

This book presents applicable knowledge of technology, equipment and applications, and the core economic issues of micromanufacturing for anyone with a basic understanding of manufacturing, material, or product engineering. It explains micro-engineering issues (design, systems, materials, market and industrial development), technologies, facilities, organization, competitiveness, and innovation with an analysis of future potential. The machining, forming, and joining of miniature / micro-products are all covered in depth, covering: grinding/milling, laser applications, and photo chemical etching; embossing (hot & UV), injection molding and forming (bulk, sheet, hydro, laser); mechanical assembly, laser joining, soldering, and packaging. □ Presents case studies, material and design considerations, working principles, process configurations, and information on tools, equipment, parameters and control □ Explains the many facets of recently emerging additive / hybrid technologies and systems, incl: photo-electric-forming, liga, surface treatment, and thin film fabrication □ Outlines system engineering issues pertaining to handling, metrology, testing, integration & software □ Explains widely used micro parts in bio / medical industry, information technology and automotive engineering. □ Covers technologies in high demand, such as: micro-mechanical-cutting, lasermachining, micro-forming, micro-EDM, micro-joining, photo-chemical-etching, photo-electro-forming, and micro-packaging

Mechanics of Materials helps students gain physical and intuitive understanding of the ideas underlying the mechanics of materials; grasp big picture ideas; and use the subject to solve problems□everything it takes to genuinely learn how the forces acting on a material relate to its deformation and failure.
