This book, framed in the processes of engineering analysis and design, presents concepts in mechanics of materials for students in two-year or four-year programs in engineering technology, architecture, and building construction; as well as for students in vocational schools and technical institutes. Using the principles and laws of mechanics, physics, and the fundamentals of engineering, *Mechanics of Materials: An Introduction for Engineering Technology* will help aspiring and practicing engineers and engineering technicians from across disciplines—mechanical, civil, chemical, and electrical—apply concepts of engineering mechanics for analysis and design of materials, structures, and machine components. The book is ideal for those seeking a rigorous, algebra/trigonometry-based text on the mechanics of materials.

The *Dictionary of Basilian Biography* contains 632 biographical entries on the members of the Congregation of Saint Basil who died in the years between 1822, when the congregation was founded, and 2002. The dictionary presents the personal background, education, and various appointments as well as the character, talents, and bibliography of each member, while defining the contribution of each in the educational or pastoral work of the Basilian Fathers. This heritage belongs not only to the Basilian Fathers or the Catholic Church, but to the wider societies and cultures of the countries that were touched by the work of the Basilians. This second edition of the *Dictionary of Basilian Biography* is approximately three times the size of the original edition by Father Robert J. Scollard, published in 1969. The increase in size is due not only to the additional number of members who died between that year and 2002, but also to additional archival research into the lives and careers of the early members of the Congregation in France. It represents eight years of work by editor P. Wallace Platt and his editorial board, enriching the book and balancing its presentation.

Traditionally, engineering education books describe and reinforce unchanging principles that are basic to the field. However, the dramatic changes in the engineering environment during the last decade demand a paradigm shift from the engineering education community. This revolutionary volume addresses the development of long-term strategies for an engineering education system that will reflect the needs and realities of the United States and the world in the 21st century. The authors discuss the critical challenges facing U.S. engineering education and present a plan addressing these challenges in the context of rapidly changing circumstances, technologies, and demands.

This book reviews the state of the art in algorithmic approaches addressing the practical challenges that arise with hyperspectral image analysis tasks, with a focus on emerging trends in machine learning and image processing/understanding. It presents advances in deep learning, multiple instance learning, sparse representation based learning, low-dimensional manifold models, anomalous change detection, target recognition, sensor fusion and super-resolution for robust multispectral and hyperspectral image understanding. It presents research from leading international experts who have made foundational contributions in these areas. The book covers a diverse array of applications of multispectral/hyperspectral imagery in the context of these algorithms, including remote sensing, face recognition and biomedicine. This book would be particularly beneficial to graduate students and researchers who are taking advanced courses in (or are working in) the areas of image analysis, machine learning and remote sensing with multi-channel optical imagery. Researchers and professionals in academia and industry working in areas such as electrical engineering, civil and environmental engineering, geosciences and biomedical image processing, who work with multi-channel optical data will find this book useful.
