What exactly is virtualization? As this concise book explains, virtualization is a smorgasbord of technologies that offer organizations many advantages, whether you're managing extremely large stores of rapidly changing data, scaling out an application, or harnessing huge amounts of computational power. With this guide, you get an overview of the five main types of virtualization technology, along with information on security, management, and modern use cases. Topics include: Access virtualization—Allows access to any application from any device Application virtualization—Enables applications to run on many different operating systems and hardware platforms Processing virtualization—Makes one system seem like many, or many seem like one Network virtualization—Presents an artificial view of the network that differs from the physical reality Storage virtualization—Allows many systems to share the same storage devices, enables concealing the location of storage systems, and more

This book provides an introduction to the mathematical and algorithmic foundations of data science, including machine learning, high-dimensional geometry, and analysis of large networks. Topics include the counterintuitive nature of data in high dimensions, important linear algebraic techniques such as singular value decomposition, the theory of random walks and Markov chains, the fundamentals of and important algorithms for machine learning, algorithms and analysis for clustering, probabilistic models for large networks, representation learning including topic modelling and non-negative matrix factorization, wavelets and compressed sensing. Important probabilistic techniques are developed including the law of large numbers, tail inequalities, analysis of random projections, generalization guarantees in machine learning, and moment methods for analysis of phase transitions in large random graphs. Additionally, important structural and complexity measures are discussed such as matrix norms and VC-dimension. This book is suitable for both undergraduate and graduate courses in the design and analysis of algorithms for data.

Don't fly blind. See how the power of experiments works for you. When it comes to improving customer experiences, trying out new business models, or developing new products, even the most experienced managers often get it wrong. They discover that intuition, experience, and big data alone don't work. What does? Running disciplined business experiments. And what if companies roll out new products or introduce new customer experiences without running these experiments? They fly blind. That's what Harvard Business School professor Stefan Thomke shows in this rigorously researched and eye-opening book. It guides you through best practices in business experimentation, illustrates how these practices work at leading companies, and answers some fundamental questions: What makes a good experiment? How do you test in online and brick-and-mortar businesses? In B2B and B2C? How do you build an experimentation culture? Also, best practice means running many experiments. Indeed, some hugely successful companies, such as Amazon, Booking.com, and Microsoft, run tens of thousands of controlled experiments annually, engaging millions of users. Thomke shows us how these and many other organizations prove that experimentation provides significant competitive advantage. How can managers create this capability at their own companies? Essential is developing an experimentation organization that prizes the science of testing and puts the discipline of experimentation at the center of its innovation process. While it once took companies years to develop the tools for such large-scale experiments, advances in technology have put these tools at the fingertips of almost any business professional. By combining the power of software and the rigor of controlled experiments, today's managers can make better decisions, create magical customer experiences, and generate big financial returns. Experimentation Works is your guidebook to a truly new way of thinking and innovating.

Keep learning, or risk becoming irrelevant. It's a truism in today's economy: the only constant is change. Technological automation is making jobs less routine and more cognitively challenging. Globalization means you're competing with workers around the world. Simultaneously, the internet and other communication technologies have radically increased the potential impact of individual knowledge. The relentless dynamism of these forces shaping our lives has created a new imperative: we must strive to become dynamic learners. In every industry and sector, dynamic learners outperform their peers and realize higher impact and fulfillment by learning continuously and by leveraging that learning to build yet more knowledge. In Never Stop Learning, behavioral scientist and operations expert Bradley R. Staats describes the principles and practices that comprise dynamic learning and outlines a framework to help you become more effective as a lifelong learner. The steps include: Valuing failure Focusing on process, not outcome, and on questions, not answers Making time for reflection Learning to be true to yourself by playing to your strengths Pairing specialization with variety Treating others as learning partners Replete with the most recent research about how we learn as well as engaging stories that show how real learning happens, Never Stop Learning will become the operating manual for leaders, managers, and anyone who wants to keep thriving in the new world of work.

You may not realize it but simple, irrelevant factors can have profound consequences on your decisions and behavior, often diverting you from your original plans and desires. Sidetracked will help you identify and avoid these influences so the decisions you make do stick—and you finally reach your intended goals. Psychologist and Harvard Business School professor Francesca Gino has long studied the factors at play when judgment and decision making collide with the results of our choices in real life. In this book she explores inconsistent decisions played out in a wide range of circumstances—from our roles as consumers and employees (what we buy, how we manage others) to the choices that we make more broadly as human beings (who we date, how we deal with friendships). From Gino's research, we see when a mismatch is most likely to occur between what we want and what we end up doing. What factors are likely to sway our decisions in directions we did not initially consider? And what can we do to correct for the subtle influences that derail our decisions? The answers to these and similar questions will help you negotiate similar factors when faced with them in the real world. For fans of Dan Ariely and Daniel Kahneman, this book will help you better understand the nuances of your decisions and how they get derailed—so you have more control over keeping them on track.
