This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the

pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or  $PO_2$  on the cell surface falls to a critical level of about 4 – 5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical  $PO_2$  . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The

purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.

The ability of cells to sense and respond to changes in oxygenation underlies a multitude of developmental, physiological, and pathological processes. This volume provides a comprehensive compendium of experimental approaches to the study of oxygen sensing in 48 chapters that are written by leaders in their fields.

Clinical Respiratory Physiology covers the practical aspects and theoretical concepts of applied respiratory physiology. The book

describes the methods of measuring ventilator capacity, lung volumes, ventilation, diffusion, cardiac output, and ventilation-perfusion rates. The text also tackles methods of measuring airway resistance and blood gases. Compliance and work of breathing, acid-base regulation, and tests of cardiorespiratory function during exercise are also looked into. Junior doctors working in respiratory units, technicians in respiratory laboratories, general physicians, and senior medical students will find the book useful.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because

they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

"The combination of scientific and institutional integrity represented by this book is unusual. It should be a model for future endeavors to help quantify environmental risk as a basis for good decisionmaking."--William D. Ruckelshaus, from the foreword. This volume, prepared under the auspices of the Health Effects Institute, an independent research organization created and funded jointly by the Environmental Protection Agency and the automobile industry, brings together experts on atmospheric exposure and on the biological effects of toxic substances to examine what is known--and not known--about the human health risks of automotive emissions.

exposing the patient to costly and stressful procedures. This book, volume 37 in the well-known Progress in Respiratory Research series, presents the state of the art in clinical chest ultrasonography. As implied by its title, it covers all aspects of ultrasound involving the chest, at the same time differentiating between routine and emergency procedures. Basic elements such as indications, investigational techniques and imaging artifacts are detailed in separate chapters. The large number of excellent illustrations and the compact text provide concise and easy-to-assimilate information about the diagnostic procedure. Apart from the printed still pictures, the book comes with a complimentary online repository containing a variety of key videos. Each chapter presents an autonomous concise overview of indications, methods, diagnoses and pitfalls and can be used as a systematic review. It is written by leading experts as
