Utility is traditionally studied in individuals' preferences for various outcomes solely to themselves. Equity theories have long considered comparison of outcomes to self and relevant others as important in determining the value of those outcomes. The present research extends prior research on utility in scenarios of interdependent outcomes. This project examined the effects of (1) zero-sum and non-zero-sum outcome games and (2) the presence or absence of explicit competing norms of distributive justice on multiple measures of utility. Findings indicated that utility sometimes differs in function between zero-sum and non-zero-sum outcomes, between situations with or without competing norms, and among different scenarios. Models that best described and predicted utility in both outcome forms shared the feature of

separately accounting for the influence of differences wherein the self receives more than the other and differences wherein the other receives more than self. The influences of game type, explicit competing norms, and scenario version on social utility are discussed.

Applied Statistics for the Social and Health Sciences provides graduate students in the social and health sciences with the basic skills that they need to estimate, interpret, present, and publish statistical models using contemporary standards. The book targets the social and health science branches such as human development, public health, sociology, psychology, education, and social work in which students bring a wide range of mathematical skills and have a wide range of methodological affinities. For these students, a successful course in statistics will not only offer statistical content but will also help them develop an appreciation for how statistical techniques might answer some of the research questions of interest to them. This book is for use in a two-semester graduate course sequence covering basic univariate and bivariate statistics and regression models for nominal and ordinal outcomes, in addition to covering ordinary least squares regression. Key features of the book include: interweaving the teaching of statistical concepts with examples developed for the course from publicly-available social science data or drawn from the literature thorough integration of teaching statistical theory with teaching data processing and analysis teaching of both SAS and Stata "side-

by-side" and use of chapter exercises in which students practice programming and interpretation on the same data set and course exercises in which students can choose their own research questions and data set. This book is for a two-semester course. For a one-semester course, see <http://www.routledge.com/9780415991544/>

For the Third Edition of Investigating Social Problems, editor A. Javier Treviño, has gathered a panel of top experts to thoroughly examine all aspects of social problems, providing students with a contemporary and authoritative introduction to the field. Each chapter is written by a well-known specialist on the topic being covered. This unique, contributed format ensures that the research and examples described are the most current and relevant available. In addition, the experts use both general theoretical approaches (structural functionalism, conflict theory, symbolic interactionism) as well as specialized theories chosen to bring additional insight and analysis to their assigned topics. The text is framed around three major themes: intersectionality (the interplay of race, ethnicity, class, and gender), the global scope of many problems, and how researchers take an evidence-based approach to studying problems. This book is intended as a textbook for a first course in applied statistics for students of economics, public administration and business administration. A limited knowledge of mathematics and - in one single chapter - some knowledge of elementary matrix algebra is required for understanding the text. Complicated mathematical proofs are avoided and the explanations are based on intuition and numerical examples. The aim of this book is to enable the student to understand the reasoning underlying a statistical analysis and to apply statistical methods to problems likely to be met within the fields of economics, public administration and business administration. The topics covered by the book are: - methods for exploratory data analysis - probability theory and standard statistical distributions - statistical inference theory - and three main areas of application: regression analysis, survey sampling and contingency tables. The treatment of exploratory data analysis, regression analysis and the analysis of contingency tables are based on the most recent theoretical developments in these areas. Most of the examples have never been presented before in English textbooks.

The COVID-19 crisis has revealed the close relationship between environmental risks and those to the foundations of human well-being – and the cascading effects on the economy and society. It has also highlighted the importance of anticipation and early action. These are also key to integrating climate policy into regional development, albeit on a larger scale.
